No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 1 ARAR74977 ID ARAR74977 ID ARAR7497 AC ARAR7497 AC ARAR7497 AC ARAR74 AC ARAR7 AAR74977 standard; protein; 235 Human Kunitz-type protease-inhibitor TFPI-2. 21-JAN-1996 AAR74977; Sprecher CA, 05-NOV-1993; 02-NOV-1994; 11-MAY-1995 WO9512674-A1 Homo anticoagulant; Kunitz-type inhibitor; protease-inhibitor; enzyme-inhibitor; (ZYMO) ZYMOGENBTICS INC. (UYNE-) UNIV NEW MEXICO STATE. sapiens. (first Kisiel W, deep vein thrombosis. 93US-00147710. 94WO-US012609. entry) Foster DC; Š

KTI is used to inhibit blood coagulation in mammals. It is particularly used as an anticoagulant and in the treatment of deep vein thrombosis, disseminated intravascular coagulations, pulmonary embolism and in the prevention of thrombosis following surgery. KTI inhibits Factor-VIIa in the absence of Factor-Xa, and thus does not require production of Factor-Xa via the intrinsic or extrinsic pathway. This KTI protein shares AA sequence homology and overall domain organization with tissue factor sequence homology and overall domain organization with tissue factor

Sequence 235 AA;

pathway-inhibitor (TFPI), and

has therefore been designated TFPI-2

Human Kunitz-type protease inhibitors - treatment of deep vein thrombosis.

used

as anticoagulants and in the

 have cytostatic activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAs and the lung tumour-associated proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with their inappropriate expression, especially lung cancers. For example, the NAs may be administered to treat diseases by rectifying mutations or deletions in a patient's general content.
                                                                             The present invention describes immunogenic portions of lung tumourassociated proteins (I) and the nucleic acids (NAs) that encode them.
                                                                                                                                         Lung tumor-associated proteins and the nucleic acids that encode them useful for preventing, diagnosing and treating lung cancer.

```
that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (1). Additionally, the NAs may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NA molecules may be administered to down regulate protein expression. The NA and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar NA sequences in samples, and hence which patients may be in need of treatment for lung cancer. The (1) may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of the protein. ARF68083 to ARF6878 and ARF76848 to ARF76878 represent human lung tumour protein related nucleotide and protein sequences which are used in the exemplification of the present expression and extinct and antagonists antagonists and antagonists and antagonists and antagonists and antag

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     disorders (e.g. cerebral oedema, hydrocephalus or brain herniations), inflammations (e.g. bacterial or viral meningitis or encephalitis), testicular disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian carcinogenic potential of a compound, or inhibiting ovarian cancer or at risk of developing ovarian cancer. The present amino acid sequence represents one of the ovarian cancer markers described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian cancer). The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzhaimer's disease or Parkinson's disease), brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Monahan JB, Garman, RB, Morrisey MP,

                                                                                                                                                                                                                                                                                                                                  The invention describes an isolated polynucleotide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynucleotide and/or polypeptide is useful for treating a lung cancer in a patient. The polypeptide is useful for removing tumour cells from a biological sample. The polynucleotide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This is the amino acid sequence of a lung tumour associated protein, described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          08-SEP-2000;

                                                                                    밁
                                                                                                                            ঠ
                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polynucleotide (I) comprising: (a) CC any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) CC complements of (a); (c) sequences consisting of at least 20 contiguous CC residues of (a); (d) sequences that hybridize to (a), under moderately CC to (a); or (f) degenerate variants of (a). Polypeptides (ABP86596-CC ABP86637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polynucleotides, CC antibodies, fusion proteins, T cell populations and antigen presenting CC cells expressing the polypeptide are useful in treating pancreatic cancer CC and stimulating an immune response. The polynucleotides can be used as CC probes or primers for nucleic acid hybridisation, in the design and CC preparation of ribozyme molecules for inhibiting expression of the tumour CC polypeptides and proteins in the tumour cells, in vaccines and for gene CC therapy. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly CC from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                The present invention relates to methods and compositions for detecting CC an angiogenesis-associated transcript in a cell in a patient. The method CC involves contacting a biological sample from the patient with a CC involves contacting a biological sample from the patient with a CC polynucleotide that selectively hybridises to a sequence at least 80% CC identical to any of the angiogenesis-associated human polynucleotide sequences comprise genes that exhibit changes in CC expression levels as a function of time in tissue undergoing angiogenesis. The method and the polynucleotide sequences of the CC angiogenesis-associated diseases e.g. cancer. The polynucleotide requences are useful for disgnosing and treating angiogenesis and CC angiogenesis-associated diseases e.g. cancer. The polynucleotide sequences are useful as a vaccine for therapeutic and prophylactic immunisation.

CC ABU03456-ABU03569 represent angiogenesis-associated protein sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14-FEB-2001;

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polynucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lung cancer-associated polypeptide; cytostatic; emphysema; atelectasis antiinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis small cell lung cancer; benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.
                                                                                                                                                                                                                                                                                                                                                        Detecting a lung cancer-associated transcript in a cell from a pat: for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13-NOV-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences ABU56408-ABU56745 represent lung cancer-associated polypeptides of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cexpression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that specifically binds to the polypepide, detecting the presence of a cancer in a patient, a fusion protein comprising the polypepide, an conditions, stimulating and/or expanding T cells specific for a tumour conditions, stimulating and/or expanding T cells specific for a tumour conditions, stimulating and/or expanding T cells specific for a tumour conditions, stimulating and/or expanding T cells specific for a tumour conditions, stimulation and/or expanding T cells specific for a tumour conditions and for a time sufficient conditions and for a time sufficient conditions and inhibiting the development of a cancer in a patient (by incubating CD4^+ and/or CD8 + T cells isolated from a patient with the polynucleotide, protein or antigen presenting cells that express the polynucleotide, such that T cells composition for stimulating at immune response in a patient of the patient. The polynucleotide, protein and for treating a cancer in a patient (particularly lung cancer). The conjonucleotide is useful for determining the presence of a cancer in a patient. The protein and oligonucleotides are useful in pharmaceutical compositions, e.g. vaccines. The polynucleotide is a patient, and in the design and conjonucleotide is useful for isolating a full-length gene from a suitable conjonucleotide is useful for isolating a full-length gene from a suitable conjonucleotide is useful for isolating a full-length gene from a suitable conjonucleotide is a protein encoded by a cDNA (full conformat directly from the USPTO a transformation, but was obtained in electronic format directly from the USPTO a transformation but was obtained in electronic conformat directly from the USPTO a transformation but was obtained in electronic conformation to the conformation of the conforma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Also included are an isolated polypeptide (comprising a sequence (S3) selected from any one of the 4 amino acid sequences mentioned in the specification, a sequence encoded by the polynucleotide, or sequences having at least 70%, preferably 90% identity to a sequence encoded by the polynucleotide), an expression vector comprising the polynucleotide operably linked to an expression control sequence, a host cell transformed or transfected with

                                                                                                                                                                                                                                                The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polypeptide associated with the compositions and methods for the therapy and diagnosis of lung cancer

                                                                                                                                                                                                                                                                                                                                  The invention relates to novel compositions and methods for the therapy and diagnosis of cancer, particularly lung cancer. The compositions comprise one or more lung tumour polypeptides, immunogenic portions therof, polynuclectides that encode such polypeptides, antigen presenting cells that express such polypeptides, and T cells that are specific for cells expressing such polypeptides, and Tells that are specific for cytostatic and immunostimulant activity. The lung tumour antigens can be used in the creation of a vaccine. The polynuclectides that encode the lung tumour selfunds can be used in gene therapy to help in the creatment of lung tumours. This sequence represents a human lung tumour clone polypeptide of the invention. This sequence was not shown in the specification. It has been taken from a World Intellectual Property
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptides and encoding polynucleotides, useful for diagnosing, preventing and/or treating lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bangur CS,

                                                                                                                                                              cell in a patient, comprises detecting
```

Claim 12; SEQ ID NO 24; 1385pp; English.

cc whose expression is upregulated or downregulated in specific cancers or cother diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a cc patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The cc invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a cc polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and mucleic acids. The nucleic acids, polypeptides, and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present of sequence represents a polypeptide of the invention. The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ક
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                닭
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a polypeptide comprising at least an immunogenic portion of a lung tumour protein or variant. The invention is useful for chihibiting the development of a cancer, particularly lung cancer, in a patient by administering to a patient an effective amount of a cancer, particularly lung cancer, in a patient by administering to a patient an effective amount of a compensation of the polypeptide, an effective amount of an antibody or antityen-binding fragment an antigen-presenting cell that expresses a polypeptide where the antigen-presenting cell is a dendritic cell, a biological sample treated by a method of the invention or an isolated T cell population prepared by a method of the invention. The pharmaceutical compositions and vaccines of the invention are also used for inhibiting the development of cancer. Methods are also provided for diagnosing cancer and also monitoring the progression of cancer. Current therapies of cancer are based on the combination of chemotherapy or suggery or radiation which prove to be inadequate in many patients. This invention provides effective vaccines and compositions which may be used in therapy. The compositions also provide early diagnostic procedures. The present sequence represents the amino acid sequence of a bursen lung times.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                 The invention relates to a novel isolated polynucleotide comprising a sequence chosen from any one of 40 lung tumour polypeptides or its complements, fragments or degenerate variants. The method of the invention has cycostatic applications and may be useful for detecting and treating lung cancer in a patient via incubating CD4+ and/or CD8+ T cells isolated from a patient with at least one component chosen from a polypeptide, polynucleotide or antigen presenting cell (APC) of the invention and administering an effective amount of the proliferated T cells to the patient. The current sequence is that of the human lung cancer-related protein of the invention. The current sequence is not shown in the specification per se but is available on the USPTO web-site http:seqdata.uspto.gov/sequence.html?DocID=20030211510.
                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotide encoding lung tumor polypeptides, useful for diagnosing, preventing and treating cancer e.g. lung cancer.
